## Job Villa - Internship Finding Platform

### About This Project

The primary objective of this project is to develop a system that acts as a bridge between students and recruiters or college and recruiters. At its simplest level, JobVilla involves finding, engaging and hiring interns and entry-level employees from college campuses. Yet, JobVilla is anything but simple.

#### PROBLEM

Professional programs require deep experiential learning with industry mentors to address talent shortages and evolving job markets. However, emerging fields like Data Science have limited job opportunities, leaving students from underserved areas lacking access to internships and career resources, highlighting the need for accessible pathways to practical experience.

#### SOLUTION

An online platform could offer virtual internships, mentorship, and networking for students from underserved areas and Tier 3-4 colleges, providing access to career opportunities in fields like Data Science and AI. This aims to democratize experiential learning and career support, empowering students for evolving job markets.

## Joyriid - Vehicle Renting App

### About This Project

JoyRiid offers a fun method for listing bikes for rental via an app. It facilitates communication and deals between bike owners and renters, allowing users to easily locate nearby options through an interactive map view. Owners can effortlessly list their bikes, ATVs, etc., with just a few simple steps.

### PROBLEM

The client required a visually appealing app to simplify the process for bike owners to list their bikes and earn extra cash. The UI had to be user-friendly and easily comprehensible. The primary focus was on implementing payment systems for bike owners and facilitating payouts through the app.

### SOLUTION

The client sought a user-friendly app, so we designed an intuitive UI for seamless navigation and incorporated walkthroughs to guide users through the app's functionality. For payments, we recommended several payment gateways supporting the payout model. The Flutter-based bike rental app proved highly effective, and the client is delighted to see their vision materialize.

## Tradooko - Live Translation App

### About This Project

The client sought an AI-based translation app capable of continuous translation by listening to users' speech, a feature limited in the market. Initially, the project aimed for continuous translation, but due to hardware constraints on phones, it pivoted to a few minutes of continuous translation.

#### | PROBLEM

The app owner faced a genuine issue: people struggled to comprehend foreign languages during speeches, public events, workshops, or seminars. Thus, there arose a need for an app capable of continuous translation by listening to the speech.

#### | SOLUTION

We identified AI translation as the solution and developed an app with large language models using Flutter. We pivoted to limited translation due to hardware constraints. The final product, built on Python, Laravel, and Flutter, is available on Android and the App Store with a membership model.

## AR Based Hair Styling App

### About This Project

This platform allows you to explore and visualize a multitude of haircuts, colors, and styles with photo-realistic accuracy. With this app, our flagship app series, you can discover the perfect look that complements your unique features. Our advanced app offers enhanced customer experiences for professionals with precise hair previews and tailor-made hairstyle presets.

### PROBLEM

In the absence of an AI-based Hair Style App, individuals encounter challenges when changing their hairstyle. Without it, they must physically visit a salon, leading to time-consuming consultations and uncertainty about the outcome. Limited options for previewing styles restrict experimentation, often resulting in individuals sticking to safer choices.

### SOLUTION

With the this App, individuals can try different hairstyles conveniently, saving time and effort. It boosts confidence by allowing users to preview styles before deciding, reducing the risk of dissatisfaction. The app offers a wide range of virtual hairstyles, encouraging experimentation and helping users find their perfect look.

## Washlo - Laundry Platform

### About This Project

The Washlo platform comprises three apps: Customer, Vendor, and Rider. Users can locate nearby laundry shops, select one, and schedule pickup times. New users receive coupons, can track riders, and report issues to support. Vendors register shops, add products, and set shop timings. The app displays all relevant information, including addresses and delivery dates. Payment options include COD, PayU, and Wallet.

### PROBLEM

The app owner encountered issues with their React-based app when adding desired features, especially with Google Maps functionality. Users struggled to find the nearest shops easily. They found Flutter more suitable for the desired functionalities and payment gateways, as React had limitations in these areas.

### SOLUTION

We developed a Flutter app that ensures easy usability and intuitive UI for all users. A key feature allows direct product delivery from nearby shops to the user's location. We addressed the client's payment gateway issue with PayU integration in Flutter. All previous issues were resolved, and new functionalities were added to the final project, built on Angular, Laravel, and Flutter, available on both Android and iOS.

## WeShare - Photo Sharing App

### About This Project

WeShare provides a complete solution for storing, organizing, and sharing photos and videos effortlessly. With cross-device accessibility and intuitive search options, users can easily access and share their media. The app's popular feature allows users to relive favorite memories, while backing up photos and videos helps free up storage space on mobile devices, enhancing convenience.

#### | PROBLEM

The problem lies in the inconvenience of individually sharing photos with group members on social media platforms, risking the loss of cherished memories, and the hassle of synchronizing pictures across drives. Additionally, the cumbersome process of asking or receiving photos in document form to preserve resolution adds further frustration.

#### | SOLUTION

The solution involves event-based photo sharing through an app, allowing users to create groups and automatically upload photos to a shared space. The app filters out blurry or duplicate images and preserves the original resolution without compression. Users can also form their own communities, ensuring a secure place to store and cherish memories.

## Morbi Mirror - News App

### About This Project

Morbi Mirror offers unbiased local news from Morbi City, Gujarat, and highlights from India. It aims to put Morbi District on Gujarat's map, showcasing local businesses globally. As the first free local news portal, it's dedicated to keeping Morbi updated with integrity.

### PROBLEM

The client possessed a WordPress news site and desired to develop a native app instead of using WebView. Upon examining their existing setup, we found it primarily consisted of articles posted as news on the website. The challenge lay in constructing the app while utilizing a WordPress site.

### SOLUTION

We developed APIs to retrieve news articles categorized by topic from the WordPress site and display them on the mobile app. As the app was read-only with no data submission to the server, the project proved to be relatively easy to implement.

## Talent Box - Social Media App

### About This Project

We aspire to establish a platform that offers equal opportunities for all emerging artists, enabling them to showcase their talents globally. Here, on this stage, seize your moment to shine and share your creativity with the world.

#### | PROBLEM

Our client desired a video streaming platform where they could create categories and challenges. Users would participate by uploading videos based on the categories they chose. After completing a video in full-screen mode, the client wanted users to return to the previous page.

#### | SOLUTION

As per the client's requirements, we divided features into different modules to facilitate easy video uploading for specific categories or challenges. Despite the client's preference for a user-friendly app, the Flutter-based video app functioned according to their specifications, allowing users to accept challenges and submit their entries.
